

## Claims

We claim:

- 1 1. A method for playing frames of a video adaptively, comprising:
  - 2 measuring a spatial frequency of pixel within frames of the video;
  - 3 measuring a temporal velocity of corresponding pixels between
  - 4 frames of the video;
  - 5 multiplying the spatial frequency by the temporal velocity to obtain a
  - 6 measure of visual complexity of the frames of the video;
  - 7 playing the frames of the video at a speed that corresponds to the
  - 8 visual complexity.
- 1 2. The method of claim 1 wherein the video is compressed.
- 1 3. The method of claim 2 wherein the spatial frequency is measured from
- 2 discrete cosine transform coefficients of the pixels in the frames, and the
- 3 temporal velocity is measured from motion vectors of corresponding pixels
- 4 between the frames.

- 1    4. The method of claim 3 wherein basis functions of the discrete cosine  
2    transformation are in a form

$$\begin{aligned} & \cos\left(\frac{\pi k_x(2x+1)}{2N}\right) \cdot \cos\left(\frac{\pi k_y(2y+1)}{2N}\right) \\ & = \cos\left(2\pi \frac{k_x}{2N}x + 2\pi \frac{k_y}{4N}\right) \cdot \cos\left(2\pi \frac{k_y}{2N}y + 2\pi \frac{k_y}{4N}\right), \end{aligned}$$

- 3  
4    where  $k_x$  is a frequency  $f_x$  in an  $x$  direction and  $k_y$  is a frequency  $f_y$  in a  $y$   
5    direction in the frame represented as

$$\cos\left(2\pi \frac{f_x}{N}x + 2\pi \frac{f_y}{N}y\right),$$

- 6  
7    where  $N$  is 8 for DCT macro-blocks.

- 1    5. The method of claim 5 wherein each basis function is a superimposition

2    of two 2D sinusoids, one with a spatial frequency  $\vec{f}_1 = \left(\frac{k_x}{2}, \frac{k_y}{2}\right)$  and another

3    with a spatial frequency  $\vec{f}_2 = \left(\frac{k_x}{2}, -\frac{k_y}{2}\right)$ .

- 1    6. The method of claim 5 wherein a particular motion vector is  $\vec{v} = (v_x, v_y)$ .

- 1    7. The method of claim 6 wherein the visual complexity resulting from the  
2    discrete cosine coefficient and the motion vectors are

3     $\omega_1 = \vec{f}_1 \cdot \vec{v}_1 = \frac{k_x}{2}v_x + \frac{k_y}{2}v_y$ , and

4     $\omega_2 = \vec{f}_2 \cdot \vec{v}_2 = \frac{k_x}{2}v_x - \frac{k_y}{2}v_y$ .

1 8. The method of claim 3 further comprising:  
2       discarding motion vectors with a low texture;  
3       median filtering the motion vectors; and  
4       fitting a global motion model to the motion vectors to reduce spurious  
5 motion vectors.

1 9. The method of claim 3 wherein the compressed video includes I-frames  
2 and P-frames, and further comprising:  
3       determined discrete cosine transformation coefficients of the P-frames  
4 by applying motion compensation; and  
5       determining motion vectors for the I-frames by interpolating the  
6 motion vectors of the P-frames.

1 10. The method of claim 1 further comprising:  
2       averaging the visual complexity over a set of frames to determine a  
3 complexity of a video segment.

1 11. The method of claim 1 further comprising:  
2       applying motion blur while plying the video to reduce aliasing.

1 12. The method of claim 1 wherein a speed of playing is inversely  
2 proportional to the visual complexity.

1 13. The method of claim 1 further comprising:  
2       applying coring to spatial filter the video while playing.

- 1 14. The method of claim 1 wherein the video is uncompressed.
- 1 15. The method of claim 1, in which a temporal distortion of the video is  
2 minimized during playback.
- 1 16. The method of claim 15, in which the minimizing uses a quantization of  
2 the visual complexity.
- 1 17. The method of claim 15, in which the minimizing uses a smoothing and  
2 filtering of the visual complexity.
- 1 18. The method of claim 15, in which the minimizing constructs a piece-  
2 wise linear approximation of the visual complexity so that the visual  
3 complexity is substantially linear.
- 1 19. The method of claim 15, in which the minimizing assigns a constant  
2 visual complexity to a consistent temporal segment of the video.
